50X1-HUM

- 1. General situation of the Yugoslav electrical industry;
- The hydroelectric central at Zvornik;
- The hydroelectric central at Jablanica; and
- 4. Projects for the construction and expansion of various hydroelectric power plants throughout Yugoslavia.

Enclosures: 6 pages as listed above; 1 sketch.

Situation of the Jugoslav Classical Juliany.

The continuation of the construction of but a few of those centrals is assured for 1953; they are:

in Serbia :	the	Central	Vlasina Zvornik
in Croatia :	11	11 11	Vinodol Peruca (on the Cetina river, at 12 kilometers above Sinj)
in Saovenia:	11	11 11	Yuzenica Yuhred (at 7 km. from the mouth of the Yuzenica river into the Drava
in Posnia :	11	11	river - the works heve barely Jablanica began) Jajce II

in "acedonia:

the Central of Mavrovo

in Contenegro:

" " " Cornja Zeta

The Central of Medvode on the Sava river - in Slovenia - is being finished; however, the machinery is not yet complete.

Only earth works or measurements are under way in all the other hydro-electric centrals.

In spite of the intense propaganda, the Ministry had to admit that the production of electric power was increased only 4 % from 1951 to 1952.

In 1952, the production of electric power reached 160 milliards (billions) bw.

The whole question conterming the electrification of Yugoslavia and the creation of the related administration is puffed up with pride by the Yugoslav Government with noisy propaganda, for ideological reasons.

However, the efective results are rather miserable, because of the catastrophic lack of skilled personnel, material, and technical equipment.

3)	Subject:	Hydro-Electric	Central of	Zvornik		
						50X1-HUM

The hydro-electric central of Zvornik was projected in 1946, and had to be completed in the course of 1952, according to the Five-Year Plan; however, the works are still in the second stage (sic), and the central can only be ready in a couple of years.

The central is located on the Drina river, south of the town Zvornik, near the village Mali (Small) Zvornik.

The works are executed by brigades of young volunteers, by the enterprise "Midrogradnja" ("Mydro-Constructions") of Belgrade. Two German made dredging machines are used for the earth excavations (Tr.rem.: May be some kind of bulldozers). The technical projects on the working ground are executed by the "Drina" squad (sic), which belongs to the mentioned enterprise of Belgrade.

The chief engineer is ing. Sava Atanacković of Bel-rade, and the director is Petar Tunjaš.

During the past fall, breause of rampaging fibres, there were grave damages concerning the construction material and the machinery as well as on the road and the bridges along the Brina river.

The machinery of the central will be sankidured by the factory "Rade Yončar" of Zagreb; one of the generators will be 30,000 kw. strong.

\mathbb{H})	Subject: Hydro-Electric Central of Jablanica	
		50X1-HUM

The construction of the hydro-electric central of Jablanica was projected in 1946; the work begun in 1948, and had to be completed in 1951, according to the Five-Year Plan.

This is one of the 17 centrals projected in the region (basin) of the Neretva river, and the only one built so far. The one located on the north, on the Rama river - which is an affluent (a tributary stream) of the Meretva - is in the first stage of construction.

The construction is damaged regularly every year by the rampaging floods, and especially during the past two years, when part of the machinery and the material were lost. One of the most sensitive spots is the underground gallery (tunnel) situated near Papraško, where the material is unloaded; this year it was flooded. The dike has to be 70 m. high, and form a lake of 14 square kilometers; this dike is now 55 m. high.

The works are mainly executed during the summer, by the so called youth brigades of volunteers.

From 1952, the construction of hydrocontrol of the states (Republics), cuted by the central (federal) Tournant of the central (federal) Tournant of the states (Republics),

that is the Administrative Council for Electric Power (sic).

The technical works in Jablanica are executed by the enterprise "Midrogradnja" ing.
and they are managed by/Danilo Protic of Delgrade. The calculations of the projects
and the technical proofs (sic) are made by the enterprise "Idroenergetika" ("MydroEnergetics") of Delgrade, Bulvar (Street) Vojvode Mišića nr. 41, which belongs to
ing. Jaroslav Černi.

The following personnel is employed on the works:

ing. Yujica Jevdjević,

ing. Bogić Knežević, and others.

The specialist for the dike is ing. Miladin Protić, of the Technical Superior School of Belgrade (Tr. rem.: Probably a professor).

Other specialists for dikes in other hydro-electric centrals are ing. Dragan Carić and ing. Erwin Neuweiler.

The hydro-electric central of Jablanica is located right under the mouth of the Rama river into the Meretva river. The waters were regulated with dikes, but (in spite of that)
just the same there were grave damages because of floods, during the last fall.

The director of the construction works is Zvonko Djako.

The contral is expected to furnish 758 million kw. per year.

where will be three karge turbines of a diameter of 10 m. each; one of them should be almost completed by new by the factory "Litostroj" of Ljubljana, and it should be about 30,000 PS (sic - I do not know what for stands this abbreviation; the Webster does not list it, and I have not yet got my "Melzi" dictionary); the other two turbines shall also be manufactured by the mentioned factory. The factory U.S. OFFICIALS ONLY

"Made "oncar" of Zagreb has also do some work for the Jablanica central.

As far as can be judged by the present situation of the construction, the central could be completed in two more years.

To the end to utilize the waters of the Meretva basin, 17 hydro-electric centrals were projected. Actually, only the one of Jablanica, and partly the one of Rama are being built.

The contral of Rama has no dike, but the steepness of the river will be used by conveying the water to the turbines through an underground tunnel (see enclosed sketch).

The Jablanica central will have a dike 70 m. high, which is now 2/3 completed.

Jablanica shall have a capacity of 180,000 km., and Rama 130,000 km.

The other projected contrals have an average capacity of 40,000 kw.

As was already said, the Jablanica central could be - at best - completed within two or three years. The one of Rama shall take more time.

The construction of the other centrals is only a matter of propaganda, because they can never be built. (مند)

The whole system of centrals was projected by in: Vujica Jevdjević.
